

# AUDIT MANAGEMENT WEB APPLICATION

*Functional Requirement & Development Understanding Report*

*Prepared from the supplied dashboard concept and workflow*

## 1. Purpose of the Application

The proposed web application is an internal Audit Management System. Its purpose is to digitally manage annual audit planning, monthly audit assignments, employee execution, Excel-based audit records, electronic signatures, completed-work submission, and deviation reporting. The application should reduce manual tracking and provide the administrator with a live dashboard showing audit status.

## 2. Main User Roles

| Role                     | Main Responsibility                                                                                | Access                                  |
|--------------------------|----------------------------------------------------------------------------------------------------|-----------------------------------------|
| Admin / Department Admin | Create annual plan, assign monthly work, monitor status, review completed audits and deviations.   | Full dashboard and management functions |
| Employee / Auditor       | View assigned plans, open assigned audit, enter audit results, attach 3 images, e-sign and submit. | Assigned work only                      |
| Reviewer (optional)      | Review deviations or submitted records when required by department workflow.                       | Review-focused access                   |

## 3. Primary Audit Modules

- Product Audit – planned and assigned audits for products/processes as defined by the department.
- Revalidation Audit – audits required for revalidation or periodic verification.
- Audit Document / Document Audit – document-related audit records, where applicable.
- Deviation Audit – used when an employee identifies an error, non-conformance or deviation during an audit.

## 4. Dashboard Concept from the Supplied Sketch

The dashboard contains a Total Audit area, Product Audit and R.V./Revalidation values, an Ongoing Audit area, completed audit information, deviation/error tracking and year/month planning controls. The exact handwritten values should be database-driven and configurable rather than hard-coded.

The dashboard image has intentionally been removed from this version of the PDF. The written specification still describes the dashboard structure and workflow represented by the sketch.

# PAGE 2 – DASHBOARD & PLANNING WORKFLOW

## 5. Dashboard Screen – Expected Behaviour

When the user opens the website, the application should first display the company/application logo and then the Audit Dashboard. The dashboard is the central navigation point.

| Dashboard Card     | Meaning                                                  | Click Action                | Data Source        |
|--------------------|----------------------------------------------------------|-----------------------------|--------------------|
| Total Audit        | All planned/active/completed audits for selected period. | Open audit summary.         | Audit records      |
| Product Audit      | Product audit count/status.                              | Open Product Audit module.  | Product audit plan |
| Revalidation Audit | Revalidation audit count/status.                         | Open Revalidation module.   | Revalidation plan  |
| Ongoing Audit      | Audits currently assigned or in progress.                | Open monthly/assigned work. | Assignment status  |
| Completed Audit    | Audits submitted and completed.                          | Open completed records.     | Submission status  |
| Deviation Audit    | Audits where employee reported an error/deviation.       | Open deviation list.        | Deviation records  |

## 6. Annual Plan – Admin Workflow

1. Admin logs into the application.
2. Admin selects the audit year, for example 2026.
3. Admin creates or imports the one-year audit plan.
4. Admin defines audit type, product/process, planned date or month, department, responsible employee and required audit format.
5. The system saves the annual plan and makes the appropriate records visible to employees according to their permissions.
6. Employee selects Product Audit or the relevant audit module and sees the one-year plan applicable to that employee/department.

## 7. Monthly / Ongoing Plan

- The Ongoing Audit card should open the current monthly plan.
- Selecting a month, for example August 2026, displays the audits planned/assigned for that month.
- The monthly plan should show Planned, Assigned, In Progress, Submitted, Completed, Deviation and Overdue statuses.
- Admin should be able to assign or reassign an audit to an employee.
- The employee should see only work assigned to that employee unless the admin grants broader access.

## 8. Suggested Status Logic

| Status      | When it is used                                                            |
|-------------|----------------------------------------------------------------------------|
| Planned     | Audit exists in annual/monthly plan but is not yet assigned.               |
| Assigned    | Admin has assigned the audit to an employee.                               |
| In Progress | Employee has opened/started the audit form.                                |
| Submitted   | Employee has completed the form and submitted it.                          |
| Completed   | Admin/reviewer has accepted the submission, or auto-completion is enabled. |
| Deviation   | Employee submitted an error/non-conformance for review.                    |
| Overdue     | Due date has passed without completion.                                    |

# PAGE 3 – EMPLOYEE EXECUTION & EXCEL FORM WORKFLOW

## 9. Employee Workflow

1. Employee logs into the application using employee ID and secure authentication.
2. Employee opens the relevant audit module from the dashboard.
3. Employee selects the planned audit and views the annual or monthly plan.
4. Employee opens an item under Assigned Work.
5. The system displays audit ID, product/process, planned date, employee ID, department, due date and audit type.
6. Employee confirms the assignment and enters/records the electronic signature.
7. The application opens the approved Excel-format audit form/template.
8. Employee fills the required audit fields/checkpoints.
9. Employee adds the required three audit images in the specified locations.
10. Employee reviews the completed record and applies the electronic signature to the final submission.
11. Employee selects Completed/Submit. The record is sent to the Admin Dashboard for review.

## 10. Excel Template Requirement

The audit form should follow the department's existing Excel format. The developer should avoid creating a completely different form unless the department approves it. The application should either render the approved template in the browser or generate a completed Excel file using the approved template.

- Preserve the approved Excel heading, column names, sequence and basic formatting.
- Map application fields to the corresponding Excel cells.
- Support the employee's audit entries/checkpoints.
- Support three images as required by the process.
- Place the electronic signature in the approved signature location.
- Save the final Excel record with a unique audit ID, employee ID, date/time and version.
- Prevent accidental overwriting of the original blank template.
- Keep a read-only copy of the submitted record for traceability.

## 11. Image Upload Requirement

| Requirement   | Expected Behaviour                                                                  | Validation                          |
|---------------|-------------------------------------------------------------------------------------|-------------------------------------|
| Image 1       | Top-left/first image position in the audit form as required by the approved format. | Mandatory if configured.            |
| Image 2       | Second audit evidence image.                                                        | Mandatory if configured.            |
| Image 3       | Third audit evidence image.                                                         | Mandatory if configured.            |
| Image quality | Allow common image formats and reasonable file size limits.                         | Reject unsupported/oversized files. |

## 12. Electronic Signature

- Employee ID should be linked to the logged-in user account.
- Electronic signature should capture the employee's confirmation that the audit entry is submitted by them.
- Recommended audit trail: employee ID, name, signature reference, signed date/time, audit ID and submission version.
- After submission, the signed record should be protected from ordinary employee editing. Corrections should use a controlled revision/reopen process.

# PAGE 4 – COMPLETION, DEVIATION & ADMIN WORKFLOW

## 13. Completed Audit Submission

After the employee completes the Excel audit form, uploads the required evidence and signs it, the employee selects Completed/Submit. The system should validate mandatory fields before submission. If validation succeeds, the audit status changes to Submitted and the record appears in the Admin Dashboard.

- Mandatory fields completed.
- Required images attached.
- Employee identity verified.
- Electronic signature completed.
- Audit date/time automatically recorded.
- Audit ID and assignment ID automatically linked.
- Submitted Excel/PDF record stored against the audit.

## 14. Deviation Audit – Error Reporting

If the employee identifies an error, abnormality, non-conformance or other deviation during the audit, a dedicated Deviation Audit action should be available.

1. Employee selects Report Deviation.
2. System links the deviation to the original audit ID and employee assignment.
3. Employee enters deviation description, location/operation, observed condition, date/time and recommended action if applicable.
4. Employee attaches supporting image(s) or evidence.
5. Employee signs and submits the deviation.
6. Admin Dashboard receives a Deviation notification/status.
7. Admin reviews, assigns responsibility and records corrective action/status.
8. Deviation is closed only after the required review/approval.

## 15. Admin Dashboard – Review

| Screen       | Admin Can See                            | Admin Action                        | Result                         |
|--------------|------------------------------------------|-------------------------------------|--------------------------------|
| Annual Plan  | Year-wise audit plan and assignments.    | Create/edit/assign.                 | Plan available to users.       |
| Monthly Plan | Current month's planned/assigned audits. | Assign/reassign/update.             | Employee work queue updated.   |
| Ongoing      | In-progress and pending work.            | Monitor/escalate/reassign.          | Status tracked.                |
| Completed    | Submitted audit records and evidence.    | Review/approve/reopen if permitted. | Record accepted or returned.   |
| Deviation    | Reported errors/non-conformances.        | Review, assign action, close.       | Deviation lifecycle completed. |

## 16. Notifications & Alerts

- New audit assigned → employee notification.
- Audit due soon → reminder.
- Audit overdue → employee and admin alert.
- Audit submitted → admin notification.
- Deviation submitted → immediate admin/reviewer notification.
- Deviation action pending → reminder.

## 17. Search, Filter & Reporting

- Filter by year, month, audit type, product/process, department, employee and status.
- Search by Audit ID, Product ID/Code or Employee ID.
- Export selected audit records to Excel/PDF where permitted.
- Provide summary counts for planned, assigned, ongoing, completed, overdue and deviation audits.

# PAGE 5 – TECHNICAL REQUIREMENTS, VALIDATION & OPEN QUESTIONS

## 18. Suggested Data Structure

| Entity       | Important Fields                                               | Purpose                           |
|--------------|----------------------------------------------------------------|-----------------------------------|
| User         | Employee ID, name, department, role, login status              | Authentication and access control |
| Audit Plan   | Plan ID, year, month, audit type, product/process, due date    | Annual/monthly planning           |
| Assignment   | Assignment ID, plan ID, employee ID, assigned date, status     | Employee work allocation          |
| Audit Record | Audit ID, entries, images, signature, timestamps, file version | Actual audit result               |
| Deviation    | Deviation ID, audit ID, description, evidence, action, status  | Error/non-conformance tracking    |
| Audit Log    | User, action, timestamp, record ID, old/new status             | Traceability and security         |

## 19. Functional Validation Checklist

- Logo/splash screen appears before the main dashboard.
- Dashboard cards are clickable and open the correct module.
- Admin can create and manage the one-year plan.
- Employee can view the one-year plan relevant to them.
- Employee can view the current one-month plan.
- Admin can assign audit work to an employee.
- Employee can open Assigned Work.
- Employee ID is automatically linked to the audit.
- Electronic signature is captured before submission.
- Approved Excel format is retained.
- Three audit images can be added and stored.
- Completed submission reaches the Admin Dashboard.
- Deviation can be submitted against the original audit.
- Admin can review completed audits and deviations.
- Audit history and timestamps are retained.
- Role-based access prevents unauthorized changes.

## 20. Items to Confirm Before Development

The supplied sketch is sufficient to understand the overall concept, but the following items should be confirmed with the department before the UI/database is finalized:

1. Exact audit module names: Product Audit, Revalidation Audit and Audit Document/Document Audit.
2. Exact dashboard card names and the meaning of each abbreviated count shown in the sketch.
3. Whether Product Audit means only product audits or includes process audits.
4. Exact annual-plan columns and monthly-plan columns.
5. Approved Excel template and the exact cells/areas for the three images.
6. Whether three images are mandatory for every audit or only for selected audit types.
7. Electronic-signature method: drawn signature, uploaded signature, OTP/e-sign service or another approved method.
8. Who can approve a completed audit and whether admin approval is mandatory.
9. Whether an employee can edit/reopen a submitted audit.
10. Deviation approval/corrective-action workflow and closure authority.
11. Required notification method: in-app, email, or both.
12. Retention period and backup requirement for audit files and images.

## 21. Final Development Understanding

The requested system should be developed as a role-based Audit Management Web Application with a dashboard-first interface. The core flow is: Admin creates the annual audit plan → monthly/ongoing audits are assigned → employee opens Assigned Work → employee completes the approved Excel audit format with required images → employee applies electronic signature → employee submits as Completed → record moves to Admin Dashboard → if an error/non-conformance is found, employee can submit a Deviation Audit linked to

the original audit. The system must maintain status, history, evidence and audit trail throughout.

**Development handover note: UI screens, database schema, API specification and Excel-template mapping should be finalized after the confirmation items above are approved.**
